

Business Continuity Plan HealthCheck

Is it time for a health check of your business continuity (BC) program? Many organisations lack the expertise or have the time available to implement and maintain a BC program to adequately protect them from a significant business interruption; loss of staff, building impact, IT systems failure, flood or fire.

If you already have a continuity program in place, it was likely developed some time ago, and it could well be out-of-date; business locations, functions, processes and IT systems will almost certainly have changed since it was developed. Further, many plans never undergo rigorous testing and statistics show that over 80% of businesses with untested continuity plans never recover from a major incident.

Our Business Continuity Health Check assesses the effectiveness of your organisations BCM program. If you don't have a plan, it will help you to identify your current level of risk exposure and the critical elements required to ensure your organisation can recover effectively from a major incident.

Approach

The assessment is undertaken via a 10 - 15 minute phone conversation with you to identify the status and appropriateness of various elements of your BCM program.

At the completion of the assessment, we provide a recovery capability/rating report, including recommendations on steps to remediate deficiencies.

Review Areas

We review the following aspects of your business continuity program:

1. BCM documentation
2. IT Disaster Recovery capability
3. Emergency Management capability
4. Alternate (recovery) site arrangements
5. Level of Risk and Business Impact Analysis
6. Audit considerations
7. Third party considerations
8. Manual workarounds

For more information or to arrange an appointment to discuss your requirements, contact us on **1300-BCPLAN** or **email us**.
