

IT Disaster Recovery Quickstart

IT Managers always understand the need for redundancy and systems recovery, however developing a formal IT Disaster Recovery Plan (DRP) for smaller organisations is difficult for a variety of reasons. As a result, many organisations are often left inadequately protected from the impacts of an incident, and if a disaster were to strike, the extended time it would take to recover critical infrastructure may have catastrophic results. At OpsCentre we understand that your business needs are as critical as other larger companies and that effective planning can be the difference between a business continuing or failing.

OpsCentre's IT DR QuickStart consulting service has been developed to help your organisation overcome these obstacles, so that you can implement a DRP as quickly and efficiently as possible.

Our Approach

Using a similar approach as we would on projects of a much larger and complex nature, our consultants complement and work with your internal IT staff and external IT providers, fast-tracking the entire DRP process by assessing key risks and impacts and developing a DRP plan for your IT infrastructure.

We utilise numerous standard templates developed through our many years of DRP experience, providing your organisation with the same professional and high-quality deliverables that you would expect as if we undertook a bespoke assignment for you.

This fixed-fee / fixed-scope service provides known project outcomes and can be completed within a 1-2 week period.

Services

IT Infrastructure Audit. We conduct a review of your production infrastructure and identify critical server and network hardware and associated software.

IT Impact Analysis. We undertake a workshop to determine your organisation's critical IT business applications, dependencies and their recovery priorities.

Disaster Recovery Plan & Technical Recovery Profiles. We document a plan and procedures for recovery and restoration of business critical applications and processes.

Deliverables are IT Infrastructure Audit, IT Impact Analysis, an IT Disaster Recovery Plan and Technical Recovery Profiles.
